1 Background

1.1 History

In the early 1980s, the PLOT3D data format gained acceptance as a *de facto* standard to enable the storage and exchange of CFD data within analysis processes, and among collaborating organizations. This initial CFD data standard today continues to be the most common storage and exchange standard for CFD data, based on structured grids.

However, by the early 1990s several limitations in the PLOT3D standard had become apparent. Individual organizations were overcoming these limitations by defining extensions to the PLOT3D standard to meet their needs. These extensions were not coordinated among different organizations, and therefore data stored in these extended formats generally could not be utilized outside the originating organization. Further, the PLOT3D standard had not anticipated several key trends in CFD technology, such as unstructured grids, turbulence models based on solutions of partial differential equations, and the need to include chemical species concentrations as part of a CFD solution. Also, the PLOT3D format, which was originally developed simply to expedite post-processing (visualization) did not include self-documenting features. Therefore, it was necessary to rely on file-naming conventions or external notes to maintain awareness of the flow conditions and analyzed geometry of each PLOT3D data file.

The CGNS Data Standard was initially conceived in 1994 by NASA, Boeing, and then-McDonnell Douglas teams working under the Integrated Wing Design element of NASA's Advanced Subsonic Technology Program. The objective of this work was to greatly reduce the time required to design a transport wing. Implicit in this goal was increased extensive use of Computational Fluid Dynamics (CFD) and the possibility of collaborative analyses by many organizations.

To achieve this vision, it was necessary to establish a common data format suitable to meet the needs of production CFD tools in the mid- to late-1990s. This format would be used to enable interchange of data among different CFD-related tools and different computing platforms, and to provide a mechanism for archive and retrieval of CFD data. The chief tools that were taken into consideration for this goal were two structured-grid multi-block codes, OVERFLOW and TLNS3D. The available data standard, the PLOT3D format, was increasingly proving to be inadequate for this purpose. Some of these shortcomings included:

- Requirement to read the entire file to retrieve any data.
- No provision for multi-block connectivity data.
- Requirement to convert to ASCII format to transfer data between dissimilar computing platforms.
- Lack of self-documentation; descriptive information must be separately maintained outside the data file.

Several database options were considered by the NASA / Boeing / McDonnell Douglas team during the period December 1994 to March 1995. In March 1995, a decision was taken to build a new data standard called CGNS (Complex Geometry Navier Stokes). This standard was a "clean sheet" development, but it was heavily influenced by the McDonnell Douglas Common File Format (CFF) standard, which had been established and deployed in 1989 and significantly revised in 1992.

It should be noted that the CGNS data standard consists of two major elements:

CGNS Steering Committee Charter

<i>Data Content and Format</i>	The definition of the intellectual content of the data to be represented in this standard, and the format of the representation in the standard-conforming data file.
<i>Implementing Software</i>	Software packages developed to ease the process of establishing CGNS-compliant database references within an applications code.

In accepted standards contexts such as ISO / STEP, the “standard” consists only of the first item, a definition of the data content and format. In this regard, the CGNS development team went beyond the traditional role in setting standards, by also developing software to easily implement the standard in a code. The implementing software, in turn, was developed in two layers:

- Low-level routines to perform elementary operations on the database, known as the *ADF (Advanced Data Format) Library*. This low-level ADF library performs basic direct I/O operations on the file. It does not have any built-in knowledge of the data structure or the content of the data. The user must provide this knowledge; thus, a user who writes ADF calls must have a complete understanding of the CGNS data structures and content.
- Higher-level routines to perform common operations required by a CFD code, known as the *CGNS Mid-Level Library*. The CGNS Mid-Level Library is an Application Programming Interface (API) that allows the use of CGNS data files without any knowledge of the underlying data structures and file format. The person who writes code using this mid-level library needs only to have a general understanding of the standard data structure and content. The purpose of the mid-level library is to shield the user from the complexity of the basic ADF calls, and to ensure that the data are written in the proper structure to create a CGNS-compliant file.

The data standards are controlled by two documents, which are available on the web site <http://www.CGNS.org>. These key control documents are:

- Standard Interface Data Structures (SIDS) document
- ADF file mapping document

The ADF library was developed during 1995, and the first large-scale deployment was made by (then) McDonnell Douglas - St. Louis in November 1995, as part of an upgrade to the Common File Format system. During 1995-97, the NASA - Boeing - McDonnell Douglas team focused on adding content to the control documents, and laying out the requirements of the mid-level library.

At a review in June 1997, the CGNS team (NASA, Boeing, and McDonnell Douglas) determined that additional professional support would be required to produce an adequate mid-level library. Subcontracts were issued to the ICEM CFD Engineering Company, in Berkeley, CA, following this decision. ICEM CFD Engineering in effect became the lead organization for the development of the mid-level library. At this time, the acronym “CGNS” was re-defined to mean “CFD General Notation System”, which was more in keeping with the evolved goals of this project.

An initial mid-level software library (version 1.0), which met the original goals of structured multi-block analysis codes, was released in May 1998. At this time, a decision also was taken whereby NASA and Boeing (McDonnell Douglas by this time had been absorbed by Boeing) would relinquish all rights to ICEM CFD Engineering. Concurrently, NASA and the informal CGNS committee determined that there was no need for export authority, so the CGNS standard, the ADF and mid-level library, and all supporting documentation could be distributed worldwide as freeware. Appropriate legal reviews and approvals were obtained at both NASA and Boeing to validate this decision.

At meetings in March, May, and October 1998, the mid-level library was extended to support a wide range of unstructured grid types. The SIDS document defining the standard was modified, and extended versions of the mid-level library were released at intervals in late 1998 and early 1999. By May 1999, the extension to unstructured grids was released.

1.2 Management

Up to this time, all activities related to the development of the standard, the implementing software, and the related documentation had been coordinated and largely funded by NASA under the Advanced Subsonic Technology Program. In 1998, NASA took a decision that the Advanced Subsonic Technology program would end on September 30, 1999, which was approximately one year earlier than their original plan. Further, NASA indicated that they would not be able to manage the development of a standard or a software system such as CGNS, once it ceased to be the focus of an ongoing NASA program.

At this time, a number of U.S. and international organizations had established plans to use the CGNS standard and the ADF and mid-level library, and in several cases they had begun implementation. These organizations had a clear interest in the existence of an organization to coordinate future use and extensions of the CGNS standard and its supporting software and documentation. Also during this same period (1998-99), The Boeing Company launched an initiative to establish an ISO standard for aerodynamic data, to be based on the CGNS standard. However, in a best-case scenario CGNS will not become an ISO standard until roughly 2005–2006, and acceptance of CGNS as an ISO standard is not a certainty. It became clear that CGNS needed to find an organizational home, to coordinate its extension and utilization.

The organizations interested in the CGNS standard met in Hampton, VA, on May 20, 1999 to discuss options for a CGNS management organization. Out of this meeting, the CGNS Steering Committee was established. This Steering Committee is a voluntary organization to coordinate the further development and dissemination of the CGNS standard and its supporting software and documentation. In January 2000, the CGNS Steering Committee became an official subcommittee under the purview of the American Institute of Aeronautics and Astronautics (AIAA) Committee on Standards. The AIAA also distributes the CGNS SIDS document as an AIAA Recommended Practice. However, this AIAA affiliation does not preclude the CGNS committee from public dissemination of the SIDS and other CGNS documentation.

The following sections of this document present the vision of how the CGNS Steering Committee will operate.

2 Mission/Vision/Responsibilities

The mission of the CGNS Steering Committee is to ensure the continuation of the CFD General Notation System. The survival of a standard depends entirely on its level of use. Therefore the CGNS Steering Committee must aim at providing a standard that is widely accepted by the CFD community.

Several elements must be satisfied to ensure the acceptance of the CGNS standard. The most obvious asset is that CGNS must be useful. Not only must it answer the current needs for the recording of fluid dynamics data, but it must also follow the changes in requirements as CFD progresses. A second important element is that CGNS must be easy to implement. The CGNS Mid-Level Library (or Application Programming Interface, API) must be user-friendly and well documented, and online support must be available for all users at all times. The standard must also be easily accessible, meaning that all the sources, binaries, documents and any other pertinent information must be available to anyone without restrictions. Finally, it is of utmost importance that CGNS retains its public nature, encouraging contributions from all users.

The Steering Committee has the responsibility to oversee that the CGNS standard remains useful, accessible, easy to use, and preserves its public nature. This implies multiple activities, which can be subdivided in the following groups:

2.1 Ensure the maintenance of the existing software, documentation and web site

The CGNS Steering Committee is responsible for appointing a prime source, and overseeing the prime source activities. The Steering Committee must ensure that the prime source maintains the existing software, documentation and web site. This includes, but is not limited to:

- correcting/updating the documentation if necessary
- fixing any reported software bug
- collecting a list of CGNS users via the web site
- keeping the web site up to date with the latest versions of the documentation and software
- informing the user base of new releases and major software problems
- posting proposals for new features or modifications to the CGNS standard on the web site and collect comments from the user base
- maintaining a distribution site for contributed software utilities which utilize the CGNS standard

2.2 Provide mechanisms for the evolution of the standard

The CGNS Steering Committee has the responsibility to support and even encourage the evolution of the standard in order for CGNS to remain useful. Therefore, the committee must solicit technical support and “in-kind” contributions. In addition, the Steering Committee must follow the policies described in [Section 4.2](#) of this document regarding the collection and evaluation of technical proposals.

2.3 Promote the acceptance of CGNS

The CGNS Steering Committee has the responsibility to promote the acceptance of CGNS throughout the CFD community. This can be achieved through various means, including word of mouth, advertising, business articles, and presentations at conferences and technical meetings.

2.4 Provide mechanism for answering questions and exchanging ideas

Electronic mail constitutes the main point of contact between CGNS users and CGNS developers. Therefore, the CGNS Steering Committee must maintain an electronic mail forum, to which users can post questions, answer questions, and exchange ideas. Members of the CGNS Steering Committee and/or appointed qualified persons will respond to the posted questions on the forum.

2.5 Determine the means by which the CGNS activities are supported

The CGNS Steering Committee has the obligation to determine the means by which all CGNS activities are supported. The Committee is also responsible for identifying and obtaining sources of funding, if appropriate. Finally the CGNS Steering Committee has the responsibility to distribute the tasks and funds to the most appropriate candidate, in the best interests of CGNS.

3 Organization/Bylaws

The CGNS Steering Committee is a voluntary organization that will determine its own policies and internal structure, and will govern by consensus whenever possible. In the absence of consensus, a two-thirds majority of the Committee members will be required to adopt changes to the standard, alter this Charter, or take other official actions.

The CGNS Steering Committee will meet at a minimum of one time per year. The time and location will be determined by consensus of the Committee, and all members of the Committee will be notified in advance.

The members of the CGNS Steering Committee will appoint a Chairperson whose responsibilities will include coordinating activities, facilitating meetings and serving as a focal point for the Committee. The Chairperson will be a member of the Committee, be elected by consensus, and serve for a two-year term. There is no limit on how many terms the Chairperson can be elected. The appointment of a secretary to maintain records will be at the discretion of the Chairperson.

The CGNS Steering Committee may decide to suggest appropriate contributions from its members. The Steering Committee is not prohibited from charging membership fees; the decision whether to do so, and the amount of the fees, lies within the purview of the Steering Committee.

All parties are welcome to bring forward issues and participate in development of the CGNS Standard, whether or not they are members of the Steering Committee.

The decision whether to support the migration of the CGNS standard to ISO/STEP, or any other organization, lies within the purview of the Steering Committee.

3.1 Representation

The CGNS Steering Committee will be made up of representatives from specific institutions, rather than individuals. Changes or additions to Steering Committee membership will be based on potential contribution to the standard. Membership on the Steering Committee will be limited to 17 institutions that actively participate in the development, maintenance, distribution and use of the CGNS Standard. No more than 5 institutions may be related, i.e., have the same parent organization. Changes to the Membership (including the limit on the number of institutions) will be determined by consensus, or if required, a two-thirds majority of the existing Membership.

The Steering Committee members as of 1 January 2004 are:

- NASA Ames
- NASA Langley
- NASA Glenn
- Boeing Commercial
- Boeing – Rocketdyne
- Boeing Integrated Defense Systems
- Pratt & Whitney
- ICEM CFD Engineering
- Fluent, Inc.
- Rolls-Royce / Allison
- U S Air Force / AEDC
- ADAPCO
- Intelligent Light
- Pointwise, Inc.

CGNS Steering Committee Charter

- Aerospatiale Matra – Airbus
- NUMECA
- ONERA

3.2 Standing Committees

The CGNS Steering Committee may constitute Standing Committees, in an ongoing or temporary basis, to which it may delegate various responsibilities. The Standing Committees will report and make recommendations to the Steering Committee who will retain the authority to act and make final decisions.

3.3 Software and Documentation Support Team

The CGNS Steering Committee will be responsible for selecting one or more organizations to maintain and distribute existing documentation and software, to develop and distribute new software resulting from extensions to the standard, and to post or distribute meeting minutes and other new documentation.

The organization(s) selected to maintain CGNS software will determine the form of newly developed software and maintain compatibility with the existing ADF Core and CGNS API.

The organization(s) selected to maintain CGNS Documentation will be responsible for posting and maintaining on the web the Steering Committee meeting minutes, Charter, and archive information.

4 Standard and Software Governing Principles

4.1 Distribution

This section describes the policy governing the distribution of the CGNS standard and software to the engineering and scientific community at large. By definition, the CGNS *standard* refers to the Standard Interface Data Structures (SIDS) definitions, the SIDS to ADF File Mapping, and the CGNS Mid-Level Library structure (API), as well as all documentation. The CGNS *software* refers to the ADF Core source code and the CGNS Library source code. The CGNS *software* may also include sample programs demonstrating the application and use of the CGNS and ADF libraries, as well as some utility programs to assist with the implementation and analysis of CGNS-based files and systems.

The CGNS Steering Committee will adhere to the philosophy used for “free software” as defined under the GNU Lesser Public License (formerly known as the GNU Library Public License — see the [Appendix](#)). Some pertinent definitions describing the motivation behind this assignment are given below.

“Free software” refers to the users’ freedom to run, copy, distribute, study, change and improve the software. More precisely, it refers to four kinds of freedom, for the users of the software:

- The freedom to run the program, for any purpose (freedom 0).
- The freedom to study how the program works, and adapt it to ones needs (freedom 1).
- The freedom to redistribute copies so one can help their neighbor (freedom 2).
- The freedom to improve the program, and release improvements to the public, so that the whole community benefits (freedom 3).

A program is free software if users have all of these freedoms. Thus, one should be free to redistribute copies, either with or without modifications, either gratis or charging a fee for distribution, to anyone anywhere. Being free to do these things means (among other things) that one does not have to ask or pay for permission.

Implementation and maintenance of the CGNS distribution policy is the responsibility of the CGNS Steering Committee. The distribution policy dictates that both the CGNS standard and the CGNS software are publicly available, and that the standard and software itself are free of charge.

It is the responsibility of the CGNS Steering Committee to enable distribution mechanisms that comply with the following principles:

- The CGNS standard (documentation and definitions) will be publicly available at no more than the cost of distribution.
- The CGNS software (ADF core and CGNS Library), including source code, will also be available at no more than the cost of distribution.
- The CGNS API (Mid-Level Library), including source code will be similarly available.
- Development, sale, and licensing of proprietary packages based on CGNS that perform substantive operations on the data, beyond the I/O performed by the API, are encouraged. Such packages must abide by the principles established in the GNU Lesser Public License (see the [Appendix](#)).

CGNS Steering Committee Charter

- The sale of services designed to assist in the conversion of existing software to the CGNS standard is acceptable.
- The voluntary contribution of software that performs operations on CGNS data is encouraged.
- The CGNS Steering Committee will provide mechanisms for the accumulation and distribution of contributed software, but will not be responsible for the function of contributed software.
- Contributed software does not become part of the CGNS Standard, that is, either the SIDS or the API, without the approval of the CGNS Steering Committee.
- The Steering Committee may agree to support or endorse additional utility software.
- The Steering Committee will *not* endorse third party software.

It is recognized and encouraged that commercial entities may wish to develop proprietary packages based on the CGNS software. In order to permit the sale of proprietary adaptations of the CGNS software, the GNU Lesser General Public License is provided in the [Appendix](#) as a guide for the declaration of rights for proprietary software.

4.2 Changes or Additions to the Standard

CGNS is a standard that has been developed with the key concepts of flexibility and extendibility in mind. The standard can accommodate the majority of CFD data quantities in practical usage today; however, some additional capabilities are still being implemented. It is also understood that in the future other additional capabilities will need to be implemented as well. For these reasons, a process for adding to or modifying the existing CGNS standard is necessary.

To address a particular need or deficiency in CGNS, a proposal for a potential change to the standard first must be made. A Technical Team will prepare all proposals. A Technical Team may voluntarily submit the proposal, or a Technical Team may be specifically appointed by the Steering Committee to author the proposal.

A primary requirement of all proposals for modifications will be to support and maintain code compatibility. No additions or changes to the CGNS standard will be adopted which invalidate existing software or data.

Prior to adoption, the Technical Team must present all proposals in an open and public forum. Included with the proposal, a draft of the necessary changes to the SIDS and File Mapping must be provided by the team introducing the modifications. The open forum will then review the proposal, identify any possible shortcomings, and suggest alternatives or improvements.

After the proposal has been presented and deliberated upon, only the Steering Committee has final authority of approval and may elect to do one of three things. First, the Steering Committee may vote by consensus (or a two-thirds majority if necessary) to accept the proposal as is, and thus the changes are approved for implementation. If such approval does not occur, the Steering Committee may still feel there is merit to the proposal, and may choose to defer acceptance of the proposal under the provision that specific changes be made. Finally, the Steering Committee may deem there is little merit in the proposed changes to CGNS, and reserves the right to reject the proposal outright. Whatever the disposition of the proposal, individual organizations may implement `UserDefined` functions, provided that they adhere to the conventions and standards as defined in the SIDS.

A GNU Lesser General Public License

GNU LESSER GENERAL PUBLIC LICENSE

Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.

59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software—to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages—typically libraries—of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public

License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the “Lesser” General Public License because it does Less to protect the user’s freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users’ freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a “work based on the library” and a “work that uses the library”. The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called “this License”). Each licensee is addressed as “you”.

A “library” means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The “Library”, below, refers to any such software library or work which has been distributed under these terms. A “work based on the Library” means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term “modification”).

“Source code” for a work means the preferred form of the work for making modifications to

it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) The modified work must itself be a software library.
- b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.
- c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.
- d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a “work that uses the Library”. Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a “work that uses the Library” with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a “work that uses the library”. The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a “work that uses the Library” uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a “work that uses the Library” with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer’s own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of

this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

- a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable “work that uses the Library”, as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)
- b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user’s computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.
- c) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.
- d) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.
- e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the “work that uses the Library” must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:
 - a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.
 - b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.
9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.
10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.
11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.
13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following

the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY “AS IS” WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.
16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the “copyright” line and a pointer to where the full notice is found.

one line to give the library's name and an idea of what it does.
Copyright (C) *year* *name of author*

This library is free software; you can redistribute it and/or modify it

CGNS Steering Committee Charter

under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public License along with this library; if not, write to the Free Software Foundation, Inc., 59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a “copyright disclaimer” for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library ‘Frob’ (a library for tweaking knobs) written by James Random Hacker.
